

I. Summary of Activities This Week:

- Max and Brock worked together to try to get the recon script, attack script, decision engine, and gui to all connect seamlessly
- Solomon worked with Brock and Max to see how the attack scripts will be able to be launched with the decision engine
- Mitch continued to build out the Windows 11 vulnerable machine to simulate a hospital's everyday environment.

II. Progress Made:

- Polished Recon GUI almost connected with the decision engine
- Decision engine has a somewhat complete thought process based on recon info
- Windows 11 vulnerable machine created and different policies have been implemented

III. Challenges or Issues Encountered:

- We are still trying to figure out the best way to collaborate on coding. Github commits seem to be a little complicated and would like a way to code with each other in real time.
- Connecting the decision engine to the recon engine has been difficult. One person working on one, while another working on the other there has been a little incompatibility with our API.

IV. Plans for Next Week:

- Finish up the attack scripts to exploit vulnerabilities in Windows 11 VM
- Make decision engine decide which attacks to use based on recon data.
- Make the Win 11 VM as HIPPA compliant as possible.
