

I. Summary of Activities This Week:

- Max polished the recon gui to work better with the incoming decision engine outputs.
- Brock continued work on the decision engine files with Max and how they were going to decide which attacks would require more recon into the vulnerable machine
- Solomon continued coding attacks and researching a solid toolbelt of them that would be pertinent to our attack scripts
- Mitch started building the Windows 11 vulnerable machine to simulate a hospital's everyday environment.

II. Progress Made:

- Polished Recon GUI ready for decision engine backend implementation
- The recon program has even more information gathering capabilities.
- Windows 11 vulnerable machine created

III. Challenges or Issues Encountered:

- We are still trying to figure out the best way to collaborate on coding. Github commits seem to be a little complicated and would like a way to code with each other in real time.

IV. Plans for Next Week:

- Create a solid 3 attack scripts to exploit vulnerabilities in Windows 11 VM
- Make decision engine decide which attacks to use based on recon data.
- Make the GUI as user friendly as possible
- Make the Win 11 VM as HIPPA compliant as possible.
